AR really needs glasses/goggles as ASAP as possible.  
This looks so depressed with everyone going to see an "art show" through their phones.

Does Adobe Aero use sound? Say I make a virtual exhibit that uses three different birds spaced far apart. When people move about with their mobile devices will the sounds of the individual birds chirping increase and decrease in response to their locations? I've looked everywhere I can think of and there's not a single mention of sound.

Is it a new software solution or a tool and system integrated into current solutions?
